Perturbing the roots of a polynomial.
Let $f(x) = \sum_{i=0}^{n} a_i x^i$ be a **monic** polynomial with **no repeated real roots**. This means that $a_n = 1$, and that all real roots of f have multiplicity 1.

(a) Let r be a root of $f(x)$. Prove that for all $\varepsilon > 0$, there exists $\delta > 0$ such that: if $g(x) = \sum_{i=0}^{n} b_i x^i$ is a monic polynomial with coefficients b_i satisfying $|a_i - b_i| < \delta$, then $g(x)$ has at least one root in the interval $(r - \varepsilon, r + \varepsilon)$.

This shows that slight perturbations of the coefficients results in slight perturbations of the roots.

(b) Suppose that f has fewer than n real roots. Prove that number of real roots of f does not change under small perturbation of the coefficients.

Proof.
(a):
First, we prove the following lemma:
Lemma. Let $r \in \mathbb{R}$ be a root of a polynomial p. Then r is a repeated root if and only if $p'(r) = 0$.
Suppose that p has a repeated root. Then we can factor p as $(x - r)^k q(x)$, for some $k > 1$ and $q \in \mathbb{P}(\mathbb{R})$. We can take the derivative of this and get that

$$p'(x) = k(x - r)^{k-1} q(x) + (x - r)^k q'(x)$$

$$\implies p'(r) = 0$$

Conversely, suppose that $p'(r) = 0$, for some $r \in \mathbb{R}$. We can write

$$p'(x) = (x - r) \sum_{i=0}^{m} c_i x^i, \text{ for constants } c_0, ..., c_m$$

We can integrate both sides to get that

$$p(x) = \int (x - r) \sum_{i=0}^{m} c_i x_i \; dx = \int x \sum_{i=0}^{m} c_i x_i - r \sum_{i=0}^{m} c_i x_i \; dx$$

$$= \sum_{i=0}^{m} \frac{c_i}{i + 2} x^{i+2} - r \sum_{i=0}^{m} \frac{c_i}{i + 1} x^{i+1} + C$$

In order for r to be a root of p, we must have that

$$p(r) = \sum_{i=0}^{m} \left(\frac{c_i}{i + 2} r^{i+2} - \frac{c_i}{i + 1} r^{i+2} \right) + C = 0$$

$$\implies C = \sum_{i=0}^{m} \left(\frac{c_i}{i + 1} r^{i+2} - \frac{c_i}{i + 2} r^{i+2} \right)$$

Therefore

$$p(x) = \sum_{i=0}^{m} \left(\frac{c_i}{i+2} x^{i+2} - \frac{c_i}{i+2} r^{i+2} + \frac{c_i}{i+1} r^{i+2} - r \frac{c_i}{i+1} x^{i+1} \right)$$

$$= \sum_{i=0}^{m} \left(\left(\frac{c_i}{i+2} \right) (x^{i+2} - r^{i+2}) - \left(\frac{c_i r}{i+1} \right) (x^{i+1} - r^{i+1}) \right)$$

$$= \sum_{i=0}^{m} \left(\left(\frac{c_i}{i+2} \right) (x-r) \sum_{j=0}^{i+1} x^j r^{i-j+1} - \left(\frac{c_i}{i+1} \right) (x-r) \sum_{j=0}^{i} x^j r^{i-j} \right)$$

$$= (x-r) \sum_{i=0}^{m} \left(\frac{c_i}{(i+1)(i+2)} \left((i+1) \left(x^{i+1} + \sum_{j=0}^{i} x^j r^{i-j+1} \right) - (i+2) \sum_{j=0}^{i} x^j r^{i-j} \right) \right)$$

Define $\Phi : \mathbb{R}^{n+2} \to \mathbb{R}$ by

$$\Phi(a_0, a_1, ..., a_{n+1}, x) = \sum_{i=0}^{n} a_i x^i.$$
